Supplier Management
Cross organizational collaboration in development & quality departments

Background

The market requirement of increasing the efficiency of the companies lead to the situation that manufactures and suppliers concentrate their energies on their core competencies. Development tasks will be outsourced to Tier1 or Tier2 suppliers in form of module or component awards.

Increasing demands in terms of product and process, more complex products, greater involvement of subcontractors in the own development process as well as the increase of interconnection between modules, components and suppliers among each other lead to an increased desire for detailing the interface between manufacturer and supplier on both sides.
Supplier Management
Cross organizational collaboration in development & quality departments
